SCALE FOR PROJECT CYBERSECURITY - RE ME - REV (/PROJECTS/CYBERSECURITY-REV ME-REV)

You should evaluate 1 student in this team

★

Git repository

```
git@vogsphere.42malaga.com:vogsphere/intra-uuid-c6e8c99b-bea2-4
```

Introduction

Please respect the following indications:
- Be polite, courteous, respectful and constructive during the process
evaluation. The well-being of the community depends on it.
- Identifies with the person or group evaluated the possible failures of the work presented. Take the
and debate
the problems you have identified.
- You must understand that not everyone understands the statements of the same
way, which means that your vision of the project or what it
requests may vary. Always keep an open mind and evaluate the way
as sincere as possible. The proper functioning of pedagogy is based on
a correct evaluation.

Guidelines

- Do not evaluate more than what is listed in the cloned git repository of the
student or group.
- Make sure that the git repository belongs to the right project,
and that it has run
"git clone" on an empty repository.
- Make sure that no aliases allow any form of cheating and that will correct
he official delivery.
- In order to avoid surprises, verify with the evaluated the
any scripts used to facilitate the evaluation.
- If, as an evaluator, you have not carried out the project you are going to evaluate,
you must read the statement completely before you begin to evaluate.
- Use the available flags to indicate an empty delivery, a
program that does not work, a cheating problem...
In these situations, the evaluation will be considered finished and the mark will be
0, or -42 if you suspect of cheating. However, except in cases of cheating,
we encourage you to continue exchanging opinions about the work
delivered, even not finished, to identify the problems that have
led to failure and avoid repeating them in the future.
- Throughout the entire evaluation, no segfault or
no program stop (unexpected, premature or uncontrolled)
In those cases, the final grade will be 0. Use the corresponding flag.
You should never have to edit any files except the
configuration, if any. In case you want to modify
a file, you must explicitly explain why you need to edit it and
agree with the evaluated student before touching any
thing.

binary.tgz (https://cdn.intra.42.fr/document/document/31737/binary.tgz)

Mandatory part

First level

You must check that a source.c file exists and that a password file exists too.
You must now download the binaries from the project page.
You must run the level1 program and use the password located in the password file.
You should have a message indicating the validation of the level.

Now that you are sure that the level is passed you should inspect the code located in the source.c f

With the help of the evaluator, you should understand how he made this code. Then you can compi
that it works
exactly like the original program.

For this first level there is no particular constraint.
However, a check with the strcmp function is expected

Yes No

Second level

You must check that a source.c file exists and that a password file exists too.
You must run the level2 program and use the password located in the password file.
You should have a message indicating the validation of the level.

Now that you are sure that the level is passed you should inspect the code located in the source.c f

With the help of the evaluator, you should understand how he made this code. Then you can compi
that it works
exactly like the original program.

For this second level there is a small algorithm used. An explanation of this is expected as well as t
different
important functions found in the original binary.

Yes No

Third level

You must check that a source.c file exists and that a password file exists too.
You must run the level3 program and use the password located in the password file.
You should have a message indicating the validation of the level.

Now that you are sure that the level is passed you should inspect the code located in the source.c f

With the help of the evaluator, you should understand how he made this code. Then you can compi
that it works
exactly like the original program.

For this last level there is an algorithm used. An explanation of this is expected as well as
the use of the different important functions found in the original binary.

Yes No

Bonus part

Evaluate the bonus part if, and only if, the mandatory part has been entirely and perfectly done, and management handles unexpected or bad usage. In case all the mandatory points were not passed defense, bonus points must be totally ignored.

First level

You must find a dedicated patch for the first level.
With the help of the person being evaluated you should apply this patch to the
original program. Then you have to check that all the passwords we will
enter validate this level.

Yes No

Second level

You must find a dedicated patch for the second level.
With the help of the person being evaluated you should apply this patch to the
original program. Then you have to check that all the passwords we will
enter validate this level.

Yes No

Third level

You must find a dedicated patch for the last level.
With the help of the person being evaluated you should apply this patch to the original program. Then you have to check that all the passwords we will enter validate this level.

Yes No

Ratings

Don't forget to check the flag corresponding to the defense
