SCALE FOR PROJECT CYBERSECURITY - FT OTP (/PROJECTS/CYBERSECURITY-FT_OTP

You should evaluate 1 student in this team

★

Git repository

```
git@vogsphere-v2.42madrid.com:vogsphere/intra-uuid-b722be60-e8
```

Introduction

Please respect the following indications:
- Be polite, courteous, respectful and constructive during the process evaluation. The well-being of the community depends on it.
- Identifies with the person or group evaluated the possible failures of the work presented. Take the and debate
the problems you have identified.
- You must understand that not everyone understands the statements of the same way, which means that your vision of the project or what it requests may vary. Always keep an open mind and evaluate the way as sincere as possible. The proper functioning of pedagogy is based on a correct evaluation.

Guidelines

- You must only evaluate what you will find in the student's or group's GiT repository.
- Take the time to check that the GiT repository matches the student or group and the project.
- Double check that no malicious alias was used to mislead you and make you grade something different from the official repository content.
- If a script supposed to help evaluate the exam is supplied by either side, the other side will have to strictly check it to avoid nasty surprises.
- If the evaluating student has not yet taken this project, they will have to read the exam subject in its entirety before starting the evaluation.
- Use the flags available on this grading system to signal an empty or non-funcional project, a norm flaw, cheating, etc. In that case, evaluation stops and final grade is 0 (or -42 if it's a cheating problem). However, if it's not a cheating problem, you are invited to keep talking about the work that has been done (or not done, as a matter of fact) in order to identify the issues that lead to this stalemate and avoid it next time.

Mandatory part

ft_otp

The program complies with the following sections:

- The algorithm uses HOTP (RFC4226) as the key building block.
- The algorithm generates keys randomly.
- There is at least 2 flags (-g -k).
- All exceptions are handled. If there is an error, you must stop the evaluation.

Yes No

Usage

According to the example on the subject you have to check that:

- Use an incorrect key size with the -g option. You should get an error.
- Use the correct key size with the -g option. You should have a new file generated you can ch is different from the basic one used.
- Use the new file generated with the -k flag. You must have a value that changes in time. This a usable password.

With the help of the person being evaluated you can compare the result with the reference tool used to complete this project.
If there is a problem, you must stop the evaluation.

☑ Yes ☒ No

Bonus part

The extra part will only be looked at if your mandatory part is flawless. This means that you will hav the mandatory part part from start to finish and that your error handling must be perfect, even in you management must be perfect, even in the face of twisted situations. If during the evaluation not all attributed, no points will be counted in the extra part.

QR generation

Does the server display a QR code with seed generation?

☑ Yes ☒ No

Graphical interface

Does the application have a graphical interface?

☑ Yes ☒ No

Ratings

Don't forget to check the flag corresponding to the defense

✔ Ok ★ Outstanding project

Empty work No author file Invalid compilation Norme Cheat Crash

Forbidden function

Conclusion

Leave a comment on this evaluation (2048 chars max)

Finish evaluation
